Medical Assistant Platform • Clinical Decision Support Report

23 July 2026 | 09:15 PM

Session ID: 18

Modules Used: X-Ray Analysis

Date: 23 July 2026 | 09:15 PM

X-Ray Analysis

Detected Region: Chest (Posteroanterior View)

Finding	Confidence
Right lower lobe consolidation	High
Normal left lung	High
Normal cardiac silhouette	High
Normal mediastinum	High
Normal diaphragm	High

■ Urgency Level: Urgent — Same day attention required

Recommendations

- Clinical correlation with patient symptoms (fever, cough, dyspnea) is essential
- Consider CT chest for further characterization if clinically indicated
- Antibiotic therapy consideration pending clinical assessment and possible sputum/blood cultures
- Follow-up chest X-ray in 4-6 weeks to confirm resolution if diagnosis of infection is confirmed

Summary: Posteroanterior chest radiograph shows a focal consolidation in the right lower lobe, most consistent with pneumonia or other acute infiltrative process. The remainder of the lungs, heart, and mediastinal structures appear unremarkable.
