23 July 2026 | 09:25 PM

Session ID: 19

Modules Used: X-Ray Analysis

Date: 23 July 2026 | 09:25 PM

X-Ray Analysis

Detected Region: Chest (Posteroanterior View)

Finding	Confidence
Right pleural effusion	High
Normal left lung	High
Normal cardiac silhouette	High
Normal mediastinum	High

■ Urgency Level: Urgent — Same day attention required

Suggested Treatment

- Investigate underlying cause of pleural effusion (clinical assessment, blood tests, imaging if indicated)
- Consider diuretics if cardiac or renal etiology suspected
- Pain management and respiratory support as needed
- Thoracentesis may be considered if effusion is causing respiratory compromise or for diagnostic purposes

Next Steps

- Correlate with clinical history and physical examination findings
- Perform blood tests including renal function, liver function, and cardiac markers
- Consider ultrasound of the chest for better characterization of the effusion (exudate vs transudate)
- If symptoms persist or effusion worsens, consider diagnostic or therapeutic thoracentesis
- Chest X-ray follow-up after treatment initiation

Summary: Chest X-ray demonstrates a right pleural effusion of moderate size with blunting of the right costophrenic angle. The left lung and cardiac silhouette are unremarkable.
