Medical Assistant Platform • Clinical Decision Support Report

23 July 2026 | 09:34 PM

Session ID: 20

Modules Used: X-Ray Analysis

Date: 23 July 2026 | 09:34 PM

X-Ray Analysis

Detected Region: Chest (Posteroanterior View)

Finding	Confidence
Right-sided pleural effusion	High
Possible right lower lobe consolidation	Medium
Normal left lung	High
Normal cardiac silhouette and mediastinum	High

■ **Urgency Level: Urgent — Same day attention required**

Recommended Tests

- Chest ultrasound or CT chest with contrast to better characterize the effusion and evaluate for underlying pneumonia or malignancy
- Pleural fluid analysis (thoracentesis) if clinically indicated to determine the nature of effusion (transudative vs exudative)
- Complete blood count and blood cultures if infection is suspected
- Liver function tests and renal function if cardiac or hepatic cause is suspected

Suggested Treatment

- Address underlying cause based on clinical presentation (antibiotics if infectious, diuretics if cardiac origin, etc.)
- Monitor respiratory status and oxygen saturation
- Consider pleural drainage if effusion is large or causing respiratory compromise
- Supportive care including adequate hydration and rest

Next Steps

- Obtain detailed clinical history including fever, cough, dyspnea, and risk factors
- Perform physical examination including auscultation for reduced breath sounds and percussion
- Order imaging confirmation (ultrasound or CT) to characterize effusion
- Consider thoracentesis for diagnostic and therapeutic purposes if effusion is significant

Summary: Chest X-ray demonstrates a right-sided pleural effusion with right lower lobe consolidation. Clinical correlation with patient symptoms and further investigation is recommended to determine the underlying etiology.
