

Session ID: 6	Modules: Symptom Checker	Generated: 19 July 2026 10:13 PM
---------------	--------------------------	------------------------------------

Primary Condition	Malaria
Likelihood	High
Assessment	Classic presentation of malaria with fever, chills, sweating, headache and joint/muscle pain. This is the most common febrile illness in West Africa and presents with this exact symptom cluster.

Recommended Tests

- Malaria parasite test (thick and thin blood smear) or RDT
- Full blood count (FBC)
- Blood glucose level
- Renal function tests (urea and creatinine)

Suggested Treatment

- Initiate artemisinin-based combination therapy (ACT) such as artemether-lumefantrine or artesunate-amodiaquine based on local guidelines and parasite resistance patterns
- Supportive care including paracetamol for fever and analgesia, adequate hydration, and electrolyte monitoring

Next Steps

- Conduct rapid malaria diagnostic testing immediately
- Monitor for severe malaria complications (cerebral malaria, severe anaemia, renal failure)
- Review treatment response after 48 hours of therapy

■ Urgency Level: Urgent

High fever with chills, sweating, headache and joint pain in a West African context strongly suggests malaria. Rapid diagnostic testing should be performed immediately. Begin appropriate antimalarial therapy while awaiting confirmatory results if clinical suspicion is high and patient appears unwell.
